The pesticide compositions of the present invention may be used by,  
5 for example, direct application to pests and/or application to the habitats of  
pests (e.g., plant bodies, animal bodies, soil).

When the pesticide compositions of the present invention are used for  
the control of pests in agriculture and forestry, their application amounts are  
usually 1 to 10,000 g/ha, preferably 10 to 500 g/ha. Formulations such as  
10 emulsifiable concentrates, wettable powders, flowables, and microcapsule  
formulations are usually used after dilution with water to have an active  
ingredient concentration of 1 to 1000 ppm, while formulations such as dusts  
and granules are usually used as such. These formulations may be directly  
applied to plants to be protected from pests. These formulations can also be  
15 incorporated into soil for the control of pests inhabiting the soil, or can also  
be applied to beds before planting or applied to planting holes or plant bot-  
toms in the planting. Further, the pesticide compositions of the present  
invention in the form of sheet formulations can be applied by the methods in  
which the sheet formulations are wound around plants, disposed in the vi-  
20 cinity of plants, or laid on the soil surface at the plant bottoms.

When the pesticide compositions of the present invention are used for  
the prevention of epidemics, their application amounts as active ingredient  
amounts are usually 0.001 to 10 mg/m<sup>3</sup> for spatial application or 0.001 to 100  
mg/m<sup>2</sup> for planar application. Formulations such as emulsifiable concen-  
25 trates, wettable powders, and flowables are usually applied after dilution  
with water to have an active ingredient concentration of 0.01 to 10,000 ppm,  
while formulations such as oil formulations, aerosols, smokes, or poison baits  
are usually applied as such.

When the pesticide compositions of the present invention are used for the control of external parasites on domestic animals such as cattle, sheep, goat, and fowl or small animals such as dogs, cats, rats, and mice, they can be used by the veterinarianily well-known methods. As the specific methods of 5 use, administration is achieved by, for example, tablets, feed incorporation, suppositories, or injections (*e.g.*, intramuscular, subcutaneous, intravenous, intraperitoneal) for systemic control, or by, for example, spraying, pour-on treatment, or spot-on treatment with an oil formulation or an aqueous solution, washing animals with a shampoo formulation, or attachment of a collar 10 or ear tag prepared from a resin formulation to animals for non-systemic control. The amounts of the present compounds when administered to animal bodies are usually in the range of 0.1 to 1000 mg per 1 kg weight of each animal.

The following will describe some formulation examples wherein parts represent parts by weight. The present compounds are designated by their compound numbers shown in Table 1.

5           **Formulation Example 1**

Nine parts of each of the present compounds (1) to (87) is dissolved in 37.5 parts of xylene and 37.5 parts of dimethylformamide, and 10 parts of polyoxyethylene styryl phenyl ether and 6 parts of calcium dodecylbenzenesulfonate are added thereto, followed by well stirring and mixing, to give an 10 emulsifiable concentrate for each compound.

**Formulation Example 2**

To 40 parts of each of the present compounds (1) to (87) is added 5 parts of Solpol<sup>®</sup> 5060 (Toho Chemical Industry Co., Ltd.), followed by well mixing, and 32 parts of Carplex<sup>®</sup> #80 (synthetic hydrated silicone oxide fine 15 powder; Shionogi & Co., Ltd.) and 23 parts of 300 mesh diatomaceous earth are added, which is mixed with a mixer to give a wettable powder for each compound.

**Formulation Example 3**

To 3 parts of each of the present compounds (1) to (87) are added 5 20 parts of synthetic hydrated silicon oxide fine powder, 5 parts of sodium dodecylbenzenesulfonate, 30 parts of bentonite, and 57 parts of clay, followed by well stirring and mixing, and an appropriate amount of water is added to

this mixture, followed by further stirring, granulation with a granulator, and air drying, to give a granule for each compound.

**Formulation Example 4**

First, 4.5 parts of each of the present compounds (1) to (87), 1 part of  
5 synthetic hydrated silicon oxide fine powder, 1 part of Doriresu B (Sankyo  
Co., Ltd.) as a flocculant, and 7 parts of clay are well mixed with a mortar,  
followed by stirring and mixing with a mixer. To the resulting mixture is  
added 86.5 parts of cut clay, followed by well stirring and mixing, to give a  
dust for each compound.

**10 Formulation Example 5**

Ten parts of each of the present compounds (1) to (87), 35 parts of  
white carbon containing 50 parts of polyoxyethylene alkyl ether sulfate am-  
monium salt, and 55 parts of water are mixed and pulverized by the wet  
grinding method to give a formulation for each compound.

**15 Formulation Example 6**

First, 0.5 parts of each of the present compounds (1) to (87) is dis-  
solved in 10 parts of dichloromethane, which is mixed with 89.5 parts of  
ISOPAR <sup>®</sup>M (isoparaffin; Exxon Chemical Co.) to give an oil formulation for  
each compound.
